EXAMINER

BACKER, FIRMIN

ART UNIT	PAPER NUMBER
----------	--------------

3621

DATE MAILED: 10/18/2004

Please find below and/or attached an Office communication concerning this application or proceeding.

**Office Action Summary**

Application No.

09/755,520

Applicant(s)

LUDWIG ET AL. *35*

Examiner

Firmin Backer

Art Unit

3621

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

**Period for Reply**

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).
- Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

**Status**

- 1) ☒ Responsive to communication(s) filed on 13 August 2004.
- 2a) ☐ This action is **FINAL**.                      2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

**Disposition of Claims**

- 4) ☒ Claim(s) 1-36 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1-36 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

**Application Papers**

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
- Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
- 11) ☐ The proposed drawing correction filed on \_\_\_\_\_ is: a) ☐ approved b) ☐ disapproved by the Examiner.
- If approved, corrected drawings are required in reply to this Office action.
- 12) ☐ The oath or declaration is objected to by the Examiner.

**Priority under 35 U.S.C. §§ 119 and 120**

- 13) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some \* c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- \* See the attached detailed Office action for a list of the certified copies not received.
- 14) ☐ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. § 119(e) (to a provisional application).
- a) ☐ The translation of the foreign language provisional application has been received.
- 15) ☐ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. §§ 120 and/or 121.

**Attachment(s)**

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☐ Information Disclosure Statement(s) (PTO-1449) Paper No(s) \_\_\_\_\_.
- 4) ☐ Interview Summary (PTO-413) Paper No(s). \_\_\_\_\_.
- 5) ☐ Notice of Informal Patent Application (PTO-152)
- 6) ☐ Other: \_\_\_\_\_.

***Continued Examination Under 37 CFR 1.114***

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on August 13<sup>th</sup>, 2004 has been entered.

***Response to Arguments***

2. Applicant's arguments with respect to claims 1-36 have been considered but are moot in view of the new ground(s) of rejection.

***Claim Rejections - 35 USC § 103***

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

4. Claims 1-36 are rejected under 35 U.S.C. 103(a) as being unpatentable over Rowney et al (U.S. Patent No. 5,996,076) in view of Patel (US PG Pub No. 2002/0004900) and in further view of Feldbau et al (U.S. Patent No. 6,571,334).

Art Unit: 3621

5. As per claims 1, 6, 11, 16, 27 and 32, Rowney et al teach a computerized method having a process flow operating over a computer network comprising a plurality of interconnected computers and a plurality of resources, each computer including a processor, memory and input/output devices, each resource operatively coupled to at least one of the computers and executing at least one of the activities in the process flow, the method comprising extracting verifiable role certificates from said electronic authorization; and verifying whether role certificates, associated with the authorization, are themselves authentic (*see fig 1C, 4, 12A, 12B, 15B, 16, 26, 30, 35, column 15 lines 10-16 line 33, 17 lines 8-18 line 34*). Rowney et al fail to teach an inventive concept of an electronic representation of the transaction and at least one verifiable anonymous role certificate for each role for which approval is required to be completed to obtain authorization of the transaction. However, Patel teach an inventive concept of an electronic representation of the transaction and at least one verifiable anonymous role certificate for each role for which approval is required to be completed to obtain authorization of the transaction (*see abstract, paragraph 0011*). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the inventive concept of Rowney et al to include Patel's electronic representation of the transaction and at least one verifiable anonymous role certificate for each role for which approval is required to be completed to obtain authorization of the transaction because this would have been desirable to use digital signature and certificate mechanisms to encode industry-wide security policy and authorization information into the signatures and certificates in order to permit the verifier of a signature to decide whether to accept the signature or certificate as valid, thus accommodating and easing electronic commerce business transactions. The combination of Rowney et al and

Art Unit: 3621

Patel fail to teach an inventive concept of certificates generated for authentication completion. However, Feldbau et al teach an inventive concept of certificates generated for authentication completion (*see column 18 lines 23-29*). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the combination of Rowney et al and Patel to include Feldbau et al's inventive concept of certificates generated for authentication completion because this can be used as evidence for the dispatch and its contents by both the sender and the recipient.

6. As per claims 2, 7, 12, 17, 28 and 33, Rowney et al teach a computerized method wherein roles associated with the role certificates are hashed and compared with hashed roles in a database of hashed roles (*see fig 1C, 4, 12A, 12B, 15B, 16, 26, 30, 35, column 15 lines 10-16 line 33, 17 lines 8-18 line 34*).

7. As per claims 3, 8, 13, 18, 29 and 34, Rowney et al teach a computerized method wherein the authorization is further insured by verifying that role certificates associated with the authorization correspond with roles in a permission set of roles of an authorization structure, the role certificates of which being required to authorize the transaction (*see fig 1C, 4, 12A, 12B, 15B, 16, 26, 30, 35, column 15 lines 10-16 line 33, 17 lines 8-18 line 34*).

8. As per claims 4, 9, 14, 19, 30 and 35, Rowney et al teach a computerized method wherein the authorization structure is an authorization tree (*see fig 1C, 4, 12A, 12B, 15B, 16, 26, 30, 35, column 15 lines 10-16 line 33, 17 lines 8-18 line 34*).

9. As per claims 5, 10, 15, 20, 31 and 36, Rowney et al teach a computerized method wherein the roles are extracted from the role certificates associated with the transaction, each extracted role being hashed and these hashed roles being concatenated and hashed again, and then concatenated with hashes of other permission sets, if any, according to the authorization structure and hashed once again, resulting in a computed hash value which may be compared to that which was signed by the Transaction Administrator, a match indicating that the transaction is authorized (*see fig 1C, 4, 12A, 12B, 15B, 16, 26, 30, 35, column 15 lines 10-16 line 33, 17 lines 8-18 line 34*).

10. As per claims 21 and 24, Rowney et al teach a Transaction Authorization Method encoded on a computer readable medium, the method having the following steps receiving a request for a transaction, obtaining an electronic representation of a document having details of the transaction from a Digital Document Database returning the transaction details to the requester awaiting and receiving from the requester the completed representation, signed by the requester requesting the Authorization Structure for the transaction from the Authorization Structure Database, the Authorization Structure being pre-signed with a signature by the Transaction Administrator and verifying the signature, and choosing a permission set of role names and user members of the permission set to contact to sign in these role names forwarding details of the transaction request with the signature of the requester to others having roles corresponding to the chosen permission set and collecting signatures of each role indicated in the permission set, requesting role certificates from the Role Certificate Database and signatures for

Art Unit: 3621

each member of the permission set and encoding the same on the document; and forwarding the completed electronic document including the signatures and role certificates to the requester, the document including authorization details required in order to confirm the validity of the transaction (*see fig 1C, 4, 12A, 12B, 15B, 16, 26, 30, 35, column 15 lines 10-16 line 33, 17 lines 8-18 line 34*). Rowney et al fail to teach an inventive concept of obtaining the role certificate signed with a signature by a Transaction Administrator from a Role Certificate Database and verifying the signature. However, Patel teach an inventive concept of obtaining the role certificate signed with a signature by a Transaction Administrator from a Role Certificate Database and verifying the signature, (*see abstract, paragraph 0011*). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the inventive concept of Rowney et al to include Patel's electronic representation of obtaining the role certificate signed with a signature by a Transaction Administrator from a Role Certificate Database and verifying the signature, because this would have been desirable to use digital signature and certificate mechanisms to encode industry-wide security policy and authorization information into the signatures and certificates in order to permit the verifier of a signature to decide whether to accept the signature or certificate as valid, thus accommodating and easing electronic commerce business transactions. The combination of Rowney et al and Patel fail to teach an inventive concept of certificates generated for authentication completion. However, Feldbau et al teach an inventive concept of certificates generated for authentication completion (*see column 18 lines 23-29*). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the combination of Rowney et al and Patel to include Feldbau et al's inventive concept of certificates generated for authentication completion

Art Unit: 3621

because this can be used as evidence for the dispatch and its contents by both the sender and the recipient.

11. As per claims 22 and 25, Rowney et al teach a Transaction Authorization Method wherein the role certificates and the Authorization Structure consist of hashed information about permission sets and roles, such hashed information substituting for the unhashed role certificates and permission sets (*see fig 1C, 4, 12A, 12B, 15B, 16, 26, 30, 35, column 15 lines 10-16 line 33, 17 lines 8-18 line 34*).

12. As per claims 23 and 26, Rowney et al teach a Transaction Verification Method encoded on a computer readable medium, the method having the following, using a verification key of the Role Authority to check each certificate on the document, in the following manner, checking the signatures on the transaction details using the verification keys in the supplied role certificates extracting the named roles from the role certificates hashing the roles using a hash-of-hashes process, checking the computed hash value of the transaction against that was originally signed by the Transaction Authority to ensure that it is equal to the value for the transaction received in the Authorization Structure, using the output of the hash-of-hashes process as input to check the signature on the hash-of-hashes process; if the produced hash-of-hashes string matches the hashed string signed by the Transaction Authority, then assuming that the request is authorized; and reporting the result (*see fig 1C, 4, 12A, 12B, 15B, 16, 26, 30, 35, column 15 lines 10-16 line 33, 17 lines 8-18 line 34*). Rowney et al fail to teach an inventive concept of receiving an electronic document representing a transaction, associated transaction details being signed by a

Art Unit: 3621

Transaction Authority, a collection of role certificates certifying named roles signed by a Role Authority, the transaction details signed by each of the signing keys corresponding to the verification keys in the role certificates, and the Authorization Structure. However, Patel teach an inventive concept of receiving an electronic document representing a transaction, associated transaction details being signed by a Transaction Authority, a collection of role certificates certifying named roles signed by a Role Authority, the transaction details signed by each of the signing keys corresponding to the verification keys in the role certificates, and the Authorization Structure, (*see abstract, paragraph 0011*). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the inventive concept of Rowney et al to include Patel's receiving an electronic document representing a transaction, associated transaction details being signed by a Transaction Authority, a collection of role certificates certifying named roles signed by a Role Authority, the transaction details signed by each of the signing keys corresponding to the verification keys in the role certificates, and the Authorization Structure, because this would have been desirable to use digital signature and certificate mechanisms to encode industry-wide security policy and authorization information into the signatures and certificates in order to permit the verifier of a signature to decide whether to accept the signature or certificate as valid, thus accommodating and easing electronic commerce business transactions. The combination of Rowney et al and Patel fail to teach an inventive concept of certificates generated for authentication completion. However, Feldbau et al teach an inventive concept of certificates generated for authentication completion (*see column 18 lines 23-29*). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the combination of Rowney et al and Patel to include Feldbau

Art Unit: 3621

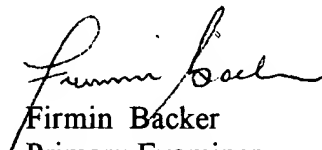

et al's inventive concept of certificates generated for authentication completion because this can be used as evidence for the dispatch and its contents by both the sender and the recipient.

### *Conclusion*

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Firmin Backer whose telephone number is (703) 305-0624. The examiner can normally be reached on Mon-Thu 9:00 AM - 5:00 PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, James Trammell can be reached on (703) 305-9768. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
